## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-3, 6-9, 12-18, 20 are rejected under 35 U.S.C. 102(b) as being anticipated by Nita et al. (US 5951539).

Nita discloses a catheter body and method of making a catheter body comprising a inner insulator formed about a central mandrel, an outer insulating around the inner insulator and a conductor wound about the inner insulator, wherein the outer and inner insulators are fused by heat to each other. A shrink-wrappable polyethylene tubing is placed on the exterior of the tubing and the assembly was heated. A polyethylene shrink-wrap pulled the various tubing members down to the coil surface. The polyethylene shrink-wrap tubing was then stripped from the exterior of the assemblies.

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Art Unit: 3742

Claims 4-5, 10-11, and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nita et al. in view of Timm et al. (US 3760812).

Nita discloses a catheter body and method of making a catheter body comprising a inner insulator formed about a central mandrel, an outer insulating around the inner insulator and a conductor wound about the inner insulator, wherein the outer and inner insulators are fused by heat to each other. Nita does not explicitly disclose an insulating spacer wound about the inner insulator with the conductors. Timm discloses a catheter having a plurality of conductors wound about an inner insulating core and having a plurality of insulating spacers wound around and between said conductors in order to isolate the conductors one from the other. It would have been obvious to one of ordinary skill in the art at the time the invention was made, in view of Timm, to modify the device of Nita et al. to include a spirally wound spacer along with the conductors in order to allow for maximum flexibility while maintaining the electrical integrity of the catheter, i.e. preventing shorting between conductors.
